BasTo6809 User Manual

Introduction

BasTo6809 is a compiler that converts a BASIC program into 6809 Assembly Language, designed to run on the TRS-80 Color Computer. The assembly code generated by BasTo6809 is ready for use with `lwasm` from the LWTTOOLS^[1] collection, allowing you to assemble and execute machine language programs on your CoCo.

This tool is ideal for anyone looking to take their BASIC programs and convert them to a 6809 assembly language for faster execution or to speed up development of assembly language code.

Version Information

BasTo6809

Version: 4.10

Author

Glen Hewlett

GitHub

BASIC-To-6809 <https://github.com/nowhereman999/BASIC-To-6809>

Dependencies

- **QB64pe** (Phoenix Edition) <https://www.qb64phoenix.com/>
- **LWASM** <http://www.lwtools.ca/>

Optional

FFMPEG <https://www.ffmpeg.org/>

Compiling BASIC Programs

Usage

```
BasTo6809 [options] program.bas
```

Where **program.bas** is the BASIC program you wish to convert to 6809 assembly language.

By default, the compiler will output a fully commented assembly language file (**program.asm**) that can be processed by **LWASM** to produce a machine code program for the Color Computer.

Command Line Options

BasTo6809 provides several command-line options to customize the behaviour of the compiler:

-coco

Use this option if your input is a tokenized Color Computer BASIC program.

-ascii

Use this option for a plain text BASIC program written in ASCII format, such as a program created with

a text editor or QB64.

-bx

Optimizes the branch lengths, affecting how efficiently LWASM assembles the program.

```
-b0 (default): Some branches may be longer than necessary, resulting in larger/slower programs.  
-b1 Ensures all branches are as short as possible, producing smaller & faster programs, but will slow  
down the assembly process.
```

-a

Makes the program autostart after it is loaded. Displays the version number of BasTo6809.

-ox

Controls the optimization level during the compilation process:

```
-o0 disables optimizations (not recommended).  
-o1 enables basic optimization.  
-o2 (default) enables full optimization for the fastest and smallest possible code.
```

-pxxxx

Specifies the starting memory location for the program in hexadecimal. Useful if you need some extra space reserved for your own program. The default starting location for the compiled program is \$2600 which is the memory space after the first **PMODE** graphics screen.

Example: **-p4000** sets the starting address at \$4000.

-sxxx

This option sets the maximum length to reserve for strings in an array. The default (and maximum) is 255 bytes. If your program use smaller strings, setting this value can reduce the amount of RAM your program uses.

Example: **-s128** reserves 128 bytes for each string.

-fxxxx

Where xxxx is the font name used for printing to the **PMODE** 4 screen (default is Arcade). Look in folder Basic_Includes/Graphic_Screen_Fonts to see font names available

-Vx

Sets the verbosity level of the compiler output.

```
-v0 (default) produces no output during compilation.  
-v1 shows basic information while compiling.  
-vx x=2,3 or 4 more info is displayed while compiling
```

-k

Keeps miscellaneous files generated during the compilation process. By default, these files are

deleted, leaving only the .asm file.

-h

Displays a help message with information on how to use **BasTo6809**.

[1] <http://www.lwtools.ca/>

Special Features

- You can write the program on a CoCo or on a modern computer using any text Editor
- New **GMODE** command allows you to choose every graphic mode the CoCo can produce, including semi graphics and if using a CoCo 3 all of the CoCo 3 graphics modes and Colour modes. Using these new screens you can use **LINE** (with B & BF), **CIRCLE** and **PAINT** commands.
- Use of line numbers is optional
- You can use Labels for sections of code to jump to (case sensitive)
- Variable names can be 25 characters long (case sensitive)
- Doesn't use any ROM calls so it's possible to use all of the 64k of RAM
- The assembly code generated is fully commented showing each BASIC line and how it is compiled. The assembly file generated can be used to help someone learn how to program in assembly language. Or allow an experienced assembly programmer to optimize the program by hand.
- Many new SDC related commands will allow you to read and write directly to the SDC filesystem from your BASIC program
- A new SDC audio playback command to play RAW audio samples directly from the SD card in the CoCoSDC
- Easily add assembly code anywhere you want in your program and easily share values of variables between BASIC and your assembly code.

Changes to BASIC's Graphic features

PMODE has been replaced by the **GMODE** command **PCLS** has been replaced by the **GCLS** command **PCOPY** has been replaced with the **GCOPY** command **LINE** command format has been changed to include a colour value and no longer uses **PSET** and **PRESET**.

The commands **PSET**, **HSET**, **PRESET**, **HRESET**, **PPOINT** or **HPOINT** are not supported. Instead they are replaced with **SET** and **POINT** commands. The compiler will use whichever graphic mode is set using the **GMODE** command and will **SET** pixels to the requested colour the user wants that matches the **GMODE** requested.

You can now use **SET,POINT,LINE,CIRCLE** & **PAINT** commands on every screen, even the regular text screen, using **GMODE 0,1**

GMODE - ModeNumber,GraphicsPage

Selects the graphics screen and the graphics page. ModeNumber is the graphics mode you want to use GraphicsPage is the Page you want to show/use for your graphics commands To see a list of ModeNumbers and the resolutions go here

Special note the ModeNumber must be an actual number and cannot be a variable as the compiler needs to know exactly which graphic mode commands to be included at compile time. GraphicsPage can be a variable. If you are going to use Graphic pages, the compiler needs to know how many pages to reserve in RAM (for CoCo 1 & 2 graphics). So you must have a "GMODE #,MaxPages" entry at the beginning of your BASIC program. Where the value of MaxPages will be an actual number and not a variable.

GCLS #

Colour the graphics screen

- # is the colour value you want the screen to be coloured

GCOPY SourcePage,DestinationPage

Makes a copy the Source graphics page to the Destination graphics page.

SourcePage

- Source graphics page

DestinationPage

- Destination graphics page

SET(x,y,Colour)

Sets a pixel on the screen

- x,y * Screen location of the pixel to be drawn
- Colour * Colour Number of the pixel to be drawn

POINT(x,y)

Returns the colour value of the pixel selected

- x,y * Screen location of the pixel value requested LINE(x0,y0)-(x1,y1),Colour[,B][F]
- x0,y0 * Starting location x1,y1 * Ending location
- Colour * Colour of the Line or Box to draw B * Draw a Box
- F * Fill the Box

PAINT(x,y), OldColour, FillColour

Fills the old colour value with the fill colour value which must also be the border colour of the section you are painting

- x,y - Starting location
- OldColour - Colour Number
- FillColour - Colour Number

CIRCLE(x,y), Radius, Colour

Draws a circle on the screen

- x,y - Origin of the circle
- Radius - Size of the circle, to keep the aspect ratio close to round Some of the graphics modes use scaling so the Radius isn't always a count of actual pixel values.
- Colour - Colour Number of the circle to draw

PALETTE v, Colour

Sets the CoCo 3 Palette value v -palette slot of 0 to 15

- v - Paletter Slot Number 0 to 15
- Colour - Colour value of 0 to 63

DRAW, GET & PUT commands are not yet available

New Commands Or Features Added To Basic

- **IF/THEN/ELSE/ELSEIF/ENDIF**
- **SELECT/CASE**
- **WHILE/WEND**
- **DO/WHILE/LOOP**
- **DO/LOOP/UNTIL**
- **PRINT #-3**, Command allows you to print text on the **PMODE** 4 screen Use **LOCATE x,y** command to locate where on the **PMODE** screen to print the text.
- **PUT** Command can use all the usual options like **PSET** (default if no option is used), **PRESET**, **AND**, **OR**, **NOT** now can use **XOR** which XORs the bits on screen with the bits of the **GET** buffer as: **99 PUT(c,y)-(c+4,y+9),Sprite1,XOR**
- **SDCPLAY** Command that plays an audio sample or song directly off the SD card in the SDC Controller.
- **SDCPLAYORC90L**, **SDCPLAYORC90R**, **SDCPLAYORC90S** these commands are similar to **SDCPLAY** except the audio is sent to the Orchestra 90 or COCOFLASH cartridge.
- SDC file access commands that allow you to Read & Write files directly on the SD card's own filesystem.
- Floating Point commands (special commands to handle floating point calculations and operations)
- **GETJOYD** * Quickly get the joystick values of 0,31,63 of both joysticks both horizontally and vertically
- **SDC_LOADM** * Loads a file from the SD card into memory.
- **SDC_SAVEM** * Saves a file from memory to the SD card.

How to use BasTo6809

The compiler is called BasTo6809 and is itself written in BASIC, specifically QB64pe (Phoenix Edition). You'll need to compile BasTo6809 code yourself it using QB64pe to create the new executable files for your system. You will be instructing QB64pe to compile the basic programs into **EXE** files which can be run on your system.

To compile the programs, you'll need to download and install QB64pe from <https://www.qb64phoenix.com/>

QB64 PE is a modern extended BASIC+OpenGL language that retains QuickBASIC 4.5 and QBasic compatibility and compiles native binaries for Windows (7 and up), Linux, and macOS (Catalina and up).

After compiling BasTo6809 with QB64pe, make sure to include a folder named **Basic_Includes** and **Basic_Commands** alongside it. These additional folders contains **.asm** libraries and other includes, which the compiler will insert into the **output.asm** file it creates from your source **.BAS** file, if needed..

The last thing you will need to do is install **lwasm** on your computer, as this assembler is required to turn the compiler's assembly output into the final machine language program. <http://www.lwtools.ca/>

LWASM is part of LWTOOLS, which is a set of cross-development tools for the Motorola 6809 and Hitachi 6309 microprocessors.

Once you're compiling folder is prepared, it's fast and easy to compile your BASIC program to machine language using the following commands:

Using MacOS or Linux:

```
./BasTo6809 -ascii BASIC.bas.  
lwasm -9b1 -p cd -o./ML.bin BASIC.asm > ./Assembly_Listing.txt`
```

Using Windows:

```
.\BasTo6809 -ascii BASIC.bas.  
lwasm -9b1 -p cd -o./ML.bin BASIC.asm > ./Assembly_Listing.txt
```

At this point you'll have an *Executable* program called **ML.bin** in the folder that you can use on a real CoCo or an emulator.

Preparing Your System To Compile Basic Programs

1 Install and test QB64pe so you're familiar with how it compiles BASIC program

2 Install LWASM on your system

Once those two programs are installed on your system, you will use QB64PE to compile at least 3 files;

- *BasTo6809.bas*
- *BasTo6809.1.Tokenizer.bas*

- *BasTo6809.2.Compile.bas*

You should also compile cc1sl.bas so it's available, if needed.

After completing these steps, you're nearly ready.

Make sure your working directory now has the BasTo6809 executable, BasTo6809.Tokenizer executable, BasTo6809.Compile executable, and the cc1sl executable program (if you compiled it), as well as the sub folders named Basic_Includes and Basic_Commands, which has the supporting **.asm**, font files and other required files in them.

With that all setup you're now good to go, here's an example of how to compile a basic program called **HELLO.BAS** from the command line:

From MacOS or Linux:

```
./BasTo6809 HELLO.BAS
```

From Windows:

```
.\BasTo6809.exe HELLO.BAS
```

If the compiler doesn't report any errors then you should now have a file saved in your directory as **HELLO.asm**. You can look through the **.asm** file with any text editor to see the assembly code the compiler created. It generates an assembly language file with a lot of comments.

The next step is to use lwasn to assemble the program into a CoCo executable program, something like this:

```
lwasn -9b1 -p cd -o./HELLO.BIN HELLO.asm > ./NEW_Assembly_Listing.txt
```

This will create an output file called **HELLO.BIN** that you can now take and use on a real CoCo or an emulator and execute.

Optimizing

To generate the fastest and smallest version of your program use this command options below:

lwasn will take a while to assemble so be patient, could be a minute or so and it may seem like nothing is happening

For MacOS and Linux:

```
./BasTo6809 -b1 HELLO.BAS
```

For Windows:

```
.\BasTo6809 -b1 HELLO.BAS
```

The only other thing you might need to do if you have a program that is very big is use the **cc1sl** program. The steps for compiling a big program are:

For MacOS and Linux:

```
./BasTo6809 -b1 HELLO.BAS  
lwasm -9b1 -p cd -o./HELLO.BIN HELLO.asm > ./NEW_Assembly_Listing.txt  
./cc1sl -l HELLO.BIN -oBIGFILE.BIN
```

For Windows:

```
.\BasTo6809 -b1 HELLO.BAS  
lwasm -9b1 -p cd -o./HELLO.BIN HELLO.asm > ./NEW_Assembly_Listing.txt  
.\cc1sl -l HELLO.BIN -oBIGFILE.BIN
```

In this case your final program to execute on the CoCo is called **BIGFILE.BIN**, you can of course call it whatever you want. Remember to only use **cc1sl** if your file is fairly big.

I remember testing it with small programs and it seemed to not work. I never did look into why at least as of yet. But it works perfect if you do have a large program.

The latest version of the compiler can be found on my GitHub site. For support, ask for help on the CoCo Nation basic-to-6809 Discord channel.

GitHub

BASIC-To-6809 <https://github.com/nowhereman999/BASIC-To-6809>

Compiling Programs for 64k RAM CoCo's

If your program requires more than 32k you must use the **cc1sl** program (CoCo 1 Super Loader). This program enables the loading of an ML program no matter where it will be loaded into RAM including where the BASIC ROM addresses are.

cc1sl

CoCo 1 Super Loader v1.03 by Glen Hewlett

Usage: cc1sl [-l] [-vx] FILENAME.BIN -oOUTNAME.BIN

[-scn] or [-csv]

Turns a CoCo 1 Machine Language program into a loadable program no matter if it over writes BASIC ROM locations and more

Where:

-l

Will add the word LOADING at the bottom of the screen while the program loads

-vx

Amount of info to display while generating the new file x can be 0, 1 or 2. Default x=0 where no info is shown

FILENAME.BIN

is the name of your big CoCo 1 program, it must end with .BIN

OUTNAME.BIN

is the name of the output file to be created otherwise it defaults to **GO.BIN**

*.scn A binary file that must end with .scn will be shown on the CoCo text screen while loading *.csv A csv text file that must end with .csv will be shown on the CoCo text screen while loading

For more info see the **cc1sl_help.txt** file

cc1sl.bas is also a QB64pe program that you must compile with QB64pe before using.

Supported BASIC commands

The following is the current list of BASIC commands that are supported by the BasTo6809 compiler.

Color Basic Commands

The following is a list of BASIC commands that are supported by the compiler.

Basic Command	Notes	Basic Command	Notes
AUDIO	ON/OFF	BUTTON	
CIRCLE		CLEAR	Only clears all the variables to zero
CLS		CASE	
DATA		DEF FN	
DIM		DO	WHILE/UNTIL
DRAW		ELSE	
ELSEIF		END	
END IF		END SELECT	
EVERYCASE		EXEC	
EXIT	DO/FOR/WHILE	FOR/NEXT	
GCLS	clear Graphic screen screen	GMODE	Set Graphics Mode
GET		GETJOYD	See technical data below
GOSUB		GOTO	
GCOPY	page to page		
IF		INPUT	
LET		LINE	
LOADM		LOCATE	Sets the cursor for text on the *MODE 4 screen LOCATE x,y, Where x is 0 to 31 and y is 0 to 184
LOOP	WHILE/UNTIL	MOTOR	ON/OFF
NEXT		ON GOSUB	
ON GOTO		PAINT	
PALETTE	v,colour		
PCLS		PLAY	
PMODE	PMODE 4 ONLY	POINT	
POKE		PRINT	Can't do PRINT USING, Use PRINT #-3,"Hello" to print on PMODE 4 screen
PRESET		PSET	
PUT		READ	

RESET		RESTORE	
RETURN		SCREEN	
SDC_CLOSE()		SDC_OPEN	
SDC_GET()		SDC_LOADM	
SDC_SAVEM		SDC_PLAY	* Multiple Variations. See SDC Commands for Audio Playback
SDC_PUTBYTE0		SDC_PUTBYTE1	
SELECT		SET	
STEP		STOP	
SOUND		TAB()	
TIMER		UNTIL	
WHILE/WEND		WPOKE	

Numeric Commands

Command	Notes	Command	Notes
ABS()	Absolute value of a number	ASC()	ASCII value of a character
BUTTON()	Returns the current state of the joystick buttons	CMPGT(FP_A,FP_B)	Floating Point Compare if Greater Than
CMPGE(FP_A,FP_B)	Floating Point Compare if Greater Than or Equal	CMPEQ(FP_A,FP_B)	Floating Point Compare if Equal
CMPNE(FP_A,FP_B)	Floating Point Compare if Not Equal	CMPLT(FP_A,FP_B)	Floating Point Compare if Less Than or Equal
CMPLT(FP_A,FP_B)	Floating Point Compare if Less Than	FLOATADD(FP_X,FP_Y)	Floating Point ADD
FLOATATAN(FP_X,FP_Y)	Floating Point ATAN	FLOATCOS(FP_X,FP_Y)	Floating Point COS
FLOATDIV(FP_X,FP_Y)	Floating Point DIV	FLOATEXP(FP_X,FP_Y)	Floating Point EXP
FLOATLOG(FP_X,FP_Y)	Floating Point LOG	FLOATMUL(FP_X,FP_Y)	Floating Point MUL
FLOATSIN(FP_X,FP_Y)	Floating Point SIN	FLOATSQR(FP_X,FP_Y)	Floating Point SQR
FLOATSUB(FP_X,FP_Y)	Floating Point SUB	FLOATTAN(FP_X,FP_Y)	Floating Point TAN
FLOATTOSTR(FP_A)	Floating Point to a string	FN()	Function call
INT()	Integer value of a number	INSTR([start],Basestring, SearchString)	Search for a string within a string
JOYSTK()	Returns the current state of the joystick	LEN()	Length of a string
PEEK()	Read a byte from memory	POINT()	Plot a point on the screen
PPOINT()	Plot a point on the screen	RND()	Random number value of 2 to 32767

RNDL()	Random number value of 2 to 255	RNDZ()	Better randomness, but a little slower, value of 2 to 255
SGN()	Sign of a number	SQR()	Square root of a number
STR\$()	String representation of a number	STRTOFLOAT(A\$)	Convert a string to a Floating Point variable
SQR()		VAL()	Convert a string to a number
WPEEK()	Read a byte from memory	WPOKE()	Write a byte to memory (Coming in the Future?)

String Commands

CHR\$()
 HEX\$()
 INKEY\$
 LEFT\$()
 MID\$()
 RIGHT\$()
 STR\$()
 STRING\$()

Logical operators

AND
 OR
 XOR
 NOT

Math operators

BASIC Command	Details	Comment
* +, -, *, /, ^,	The general math operators	
MOD	Remainder of division	
DIVR	Same as / except the result is rounded to the nearest value.	For compatibility DIVR accepts \ as integer division (which is the same as /)

GETJOYD Technical Details

This command will get the joystick values of 0,31,63 of both joysticks both horizontally and vertically. Results are stored same place BASIC normally has the Joystick readings:

Joystick	Vertical	Horizontal
LEFT	\$15A	\$15B
RIGHT	\$15C	\$15D

SDC Related Commands

Details about the new commands for users of the CoCoSDC.

You can use the new SDC_LOADM and SDC_SAVEM commands to directly read and write files and folders on the SD card installed in your CoCoSDC.

SDC_LOADM"FILENAME.BIN",#[,Offset]

Loads a machine language binary file into the computer from the SDC directly.

* is the file number 0 or 1
Offset * is optional, if it's included this amount will be added to the original LOADM address.

SDC_SAVEM"FILENAME.BIN",#,Start,End,Exec

Saves a section of memory to the SDC directly

is the file number 0 or 1
Start Address in memory to start copying from
End Address in memory to stop copying from
Exec Address where the program should start execution
Saves a section of memory to the SDC directly

SDC_OPEN"FILENAME.EXT",'X',#

Opens file for Reading from or Writing to the SD card directly.

FILENAME.EXT * can be any 8 character filename with a 3 character extension
X * is either an R for Read or W for Write
* is the file number to open. This must be either a 0 or a 1

SDC_CLOSE(#)

Closes the open file where # is 0 or 1

SDC_PUT0 x

Writes a single byte variable x to the open file 0

SDC_PUT1 x

Writes a single byte variable x to the open file 1

x=SDC_GETBYTE(#)

Reads a single byte from the open file number (0 or 1) and stores the value in variable

x, auto increments so the next read will be the next byte in the file.

* is the file number. This must be either a 0 or a 1

Optionally use the SDC_SETPOS() command to set the starting location in the file.

SDC_SETPOS(#,a,b,c,d)

Sets the position in the file to read.

```
# * is the file number (0 or 1)
a,b,c are the Logical sector number (24 bit number of the 256 byte sectors)
a * Most significant byte
b * Mid significant byte
c * Least significant byte
d * The byte in the selected sector (zero based)
```

For example:

So if you wanted to get the byte 300 in the open file #1 you would use: **SDC_SETPOS(1,0,0,1,43)**

The position would points at the 300th byte. With **n=SDC_GET(1)** so **n** now has the value of the 300th byte, the next **SDCGET(1)** command will get the 301st byte and so on.

A\$=SDC_FILEINFO\$(#)

This will copy the 32 bytes of file info to a string variable such as **A\$** the info can be useful for calculating the file size.

```
# is the file number either 0 or 1.
This is the layout of the bytes in the string:
1-8 File Name
9-11 Extension
12 Attr. bits: $10=Directory, $04=SDF Format, $02=Hidden, $01=Locked
29-32 File Size in bytes (LSB first)
```

x=SDC_DELETE(A\$)

Delete a file or empty directory on the SDC

```
A$ = variable with the full path to the empty directory or file you want delete.
Result in x where x is:
0 No Error
1 SDC busy too long
3 Path name is invalid
4 Miscellaneous hardware error
5 Target file or directory not found
6 Target directory is not empty
```

SDC Commands related to SD card directories

x=SDC_MKDIR(A\$)

Make a directory on the SDC A\$ = variable with the full path to the directory you wish to make Result in x where x is:

```
0 No Error
1 SDC busy too long
3 Path is invalid
4 Miscellaneous hardware error
5 Parent directory not found
6 Name already in use
```

x=SDC_SETDIR(A\$)

Sets the directory on the SDC A\$ = variable with the full path to the directory you change to Result in x where x is:

```
0 No Error
1 SDC busy too long
3 Path is invalid
4 Miscellaneous hardware error
5 Target directory not found
```

A\$=SDC_GETCURDIR()

GET CURRENT DIRECTORY - Retrieves information about the Current Directory for the SD card String variable A\$=Directory info string where the following bytes are:

```
1-8  Filename
9-11 Extension
12-31 Private
```

x=SDC_INITDIR(A\$)

First step to getting a directory listing.

```
To get a directory you must first use this command to setup where and what to list on the directory.
A$ = variable to the full path name of the target directory.
The final component of the path name should be a wildcard pattern that will be used to filter the list
of returned items.
```

Example:

A\$="MYDIR/.*"

will list everything in MYDIR

A\$="MYDIR/*.TXT"

will list files ending with .TXT Result in x where x is:

```
0 No Error
1 SDC busy too long
3 Path is invalid
4 Miscellaneous hardware error
5 Target directory not found
```

SDC_DIRPAGE A\$,B\$,x

Second step to getting a directory listing.

This command returns a 256 byte data block which is divided into 16 records of 16 bytes each. Each record describes one item. If there are not enough items to fill the entire page then unused records are filled with zeroes. You may continue to send commands for additional pages until a page containing at least one unused record is returned. Since the directory listing is 256 bytes and the max size of a string is 255 bytes. The listing is split into two string variables with 128 bytes of the directory each.

The first variable **A\$** will get the the first 128 bytes and the second variable **B\$** will get the second 128 bytes of the directory listing. Each entry is:

```
1-8 File Name
9-11 Extension
2 Attribute bits
$10=Directory,
$02 Hidden,
$01 Locked
13-16 Size in bytes (MSB first)
```

Result in x where x is:

```
0 No Error
1 SDC busy too long
4 Listing has not been initiated or already reached the end of a listing
```

SDC Commands for Audio Playback

- **SDC_PLAY** - Playback mono audio samples at 44.75 kHz
- **SDC_PLAY0RC90L** - Playback mono audio samples at 44.75 kHz
- **SDC_PLAY0RC90R** - Playback mono audio samples at 44.75 kHz
- **SDC_PLAY0RC90S** - Playback stereo audio samples at 22.375 kHz
- **SDC_PLAY** - Playback an audio file directly stored on the SDC output through the CoCo directly.

Usage:

```
SDC_PLAY"MYAUDIO.RAW"
```

While the sample is playing you can press the BREAK key to stop it.

In order for you to get your audio sample in the correct format to be played back you'll need to prepare your audio samples and put them on the SD card. The format for the raw audio file that will be played is mono 8 bits unsigned. To convert any sound file or even the audio from a video file to the correct format used with the SDCPLAY command use **FFMPEG** and the following command: (Note: all one line)

```
ffmpeg -i source_audio.mp3 -acodec pcm_u8 -f u8 -ac 1 -ar 44750 -af
aresample=44750:filter_size=256:cutoff=1.0 MYAUDIO.RAW
```

SDC_PLAYORCL & SDC_PLAYORCR use the same audio format as the regular SDC_PLAY command except the output is sent to the Orchestra90/COCOFLASH Left or Right speaker.

If you want to stream 8 bit stereo sound from your CoCo to the COCOFLASH/Orchestra90 use the command:

```
SDC_PLAYORCR90S"MYSAMPLE.RAW"
```

MYSAMPLE.RAW is stored on the SD card in your SDC Controller. It is can be created with the **FFMPEG** command below: (Note: all one line)

```
ffmpeg -i source_audio.mp3 -acodec pcm_u8 -f u8 -ac 2 -ar 22375 -af
aresample=22375:filter_size=256:cutoff=1.0 MYSAMPLE.RAW
```

Floating Point Commands

One of the things that makes a compiler so fast is that it uses integer math. If you must use floating point math and you don't mind the slowdown in speed you can use the following commands.

Command	Description	Command	Description
FLOATADD(FP_X,FP_Y)	Floating Point ADD	FLOATATAN(FP_Y)	Floating Point ATAN
FLOATCOS(FP_Y)	Floating Point COS	FLOATDIV(FP_X,FP_Y)	Floating Point DIV
FLOATEXP(FP_X)	Floating Point EXP	FLOATLOG(FP_X)	Floating Point LOG
FLOATMUL(FP_X,FP_Y)	Floating Point MUL	FLOATSIN(FP_X)	Floating Point SIN
FLOATSQR(FP_Y)	Floating Point SQR	FLOATSUB(FP_X,FP_Y)	Floating Point SUB
FLOATTAN(FP_X)	Floating Point TAN		

Floating Point String conversion commands:

Command	Description	Command	Description
FLOATTOSTR(FP_A)	Floating Point number to a string	STRTOFLOAT(A\$)	Convert a string to a Floating Point variable

Floating Point Comparison commands:

Command	Description	Command	Description
CMPGT(FP_A,FP_B)	Floating Point Compare if Greater Than	CMPGE(FP_A,FP_B)	Floating Point Compare if Greater Than or Equal
CMPEQ(FP_A,FP_B)	Floating Point Compare if Equal	CMPNE(FP_A,FP_B)	Floating Point Compare if Not Equal
CMPLE(FP_A,FP_B)	Floating Point Compare if Less Than or Equal	CMPLT(FP_A,FP_B)	Floating Point Compare if Less Than

In order to use floating point variables you must prefix the variable name with **FP_**, for example:

```
FP_X=FLOATSQR(12.33452)
```

FP_X will now equal 3.51205353

```
FP_Var5=100.12345
```

FP_X and a variable named **X** are *different* variables. **X** will be a signed 16 bit integer and **FP_X** is a floating point number.

Variable conversions can only be done directly as a single command and not in two steps. You cannot do FP functions assigned directly to a signed integer variable:

```
X=FLOATMUL(100,0.100912345)
```

You must do it in two steps, first use a floating point variable with the the math function as

```
FP_Var5=FLOATMUL(100,0.100912345)
```

Results **FP_Var5 = 100.912345**

Then copy the floating point number to the signed integer variable as **X=FP_Var5** then **X** will equal 101 (rounding is done)

You can assign a **FP** number directly to a signed int as: **X=100.912345** then **X** will equal 101 (rounding is done)

X=FP_Var1 then **X** will equal the signed integer value of the floating point variable **FP_Var1**

C(3,6)=FP_Var2 then the array **C(3,6)** will equal the signed integer value of the floating point variable **FP_Var2** Conversion from signed integers to **FP** variables can be done directly as **FP_Var1=X**

If you want to assign an equation of signed ints to a floating point variable it must be done with the **INT()**

command **FP_Var1=INT(X*32+Y/5)**

Input values of the commands can be any of the following:

A floating point variable such as **FP_MyFloatVariable1** as

```
FP_Var2=FLOATADD(FP_MyFloatVariable1,FP_Var1)
```

A floating point number such as 100.352 as:

```
FP_Var2=FLOATADD(FP_Var1,100.352)
```

A regular 16 bit signed variable, must use **INT()** as:

```
FP_Var2=FLOATADD(FP_Var1,INT(X))
```

A regular 16 bit signed expression, must use **INT()** as:

```
FP_Var2=FLOATADD(INT(X*23+F),FP_Var1)
```

You can not do complicated equations with floating point math directly. You must do the equation in steps.

Example

if you wanted to do **FP_Var1=FP_Var2*55.234+63.56*X**

You would need to do this as:

```
FP_Temp1=FLOATMUL(FP_Var2,55.234)
FP_Temp2=FLOATMUL(63.56,INT(X))
FP_Var1=FLOATADD(FP_Temp1,FP_Temp2)
```

To convert user input to a floating point number it must be in a string variable and converted to a floating point number with the command **STRTOFLOAT(A\$)** useful for converting user input into float values.

Example:

```
INPUT'ENTER A NUMBER';N$
FP_Var1=STRTOFLOAT(N$)
```

To do comparisons with Floating point numbers you must use one of:

- **CMPGT(FP_A,FP_B)** - Floating Point Compare if Greater Than
- **CMPGE(FP_A,FP_B)** - Floating Point Compare if Greater Than or Equal

- **CMPEQ(FP_A,FP_B)** - Floating Point Compare if Equal
- **CMPNE(FP_A,FP_B)** - Floating Point Compare if Not Equal
- **CMPLE(FP_A,FP_B)** - Floating Point Compare if Less Than or Equal
- **CMPLT(FP_A,FP_B)** - Floating Point Compare if Less Than

Example:

```
IF CMPGT(FP_Var1,VP_Var6) THEN ?'VP_Var6 is > VP_Var1*
```

These special comparisons must be done on their own after the IF statement. Anything after the first CMPxx(,) will be ignored.

If you wanted to do: **IF CMPGT(FP_Var1,VP_Var6) AND A=B THEN ...**, for example;

You would need to do this as:

```
IF CMPGT(FP_Var1,VP_Var6) THEN IF A=B THEN ...
```

Another example:

```
IF CMPGT(FP_Var1,VP_Var6) OR A=B THEN ...
```

You would need to do this as:

```
IF CMPGT(FP_Var1,VP_Var6) THEN IF A=B THEN ...
ELSE IF A=B THEN ...
```

Additional Floating Point Details

Printing of floating point numbers directly will display a kind of broken scientific version of the floating point number on screen. You can use the function **FLOATTOSTR(FP_A)** Which cleanly formats a Floating Point number to a string which you can then print on screen. Although the number is still going to display in scientific notation. You can use the code below to show floating point numbers formatted as normal numbers. The variable **V\$** can be manipulated as you want with regular string commands like **MID\$** to format the string as you want for your program.

```
FP_C=FLOATMUL(-234.54321,234.54321)
FP$=FLOATTOSTR(FP_C)
' Get the sign of the number
S$=LEFT$(FP$,1)
' Get the numbers without the decimal
N$=MID$(FP$,2,1)+MID$(FP$,4,8)
' Get the Exponent + 1
E=VAL(RIGHT$(FP$,3))+1
SELECT CASE E
```

```

CASE IS <1
V$=S$+"0."+STRING$(-E,"0")+N$
CASE 1 TO 8
V$=S$+LEFT$(N$,E)+"."+RIGHT$(N$,9-E)
CASE IS >8

V$=S$+N$+STRING$(E-9,"0")
End Select
?"FP$=";FP$
?"V$=";V$

```

Output is: **FP\$=-5.50105174E+04 V\$=-55010.5174**

This is a tweaked version of James Diffendaffer's 3D plot program that I converted to working on a CoCo 3 to work on a CoCo 1 & 2

```

0 CX=250:CY=192:*PMODE* 4,1:*PCLS*:SCREEN 1,1
1 DIM R(250):FOR I=0 TO CX:R(I)=CY:NEXT I:GOTO 10
2 R=SQR(X*X+Y*Y)*1.5: IF R=0 THEN F=90:GOTO 4
3 F=90*SIN(R)/R
4 A=10*X+125-5*Y:B=5*Y+2.5*X+93:RETURN
10 FOR Y=10 TO -10 STEP -0.1
70 FOR X=10 TO -10 STEP -0.1
80 GOSUB 2
82 IF A<0 THEN A=0
83 IF A>255 then A=255
84 IF R(A)>B-F THEN R(A)=B-F:*PSET*(A,B-F)
90 NEXT X,Y
101 GOTO 101

```

Below is a version of the same program but ready to be compiled with the new floating point commands. Note that you can't use floating point numbers with the FOR NEXT commands so this is a work around.

```

0 CX=250:CY=192:*PMODE* 4,1:*PCLS*:SCREEN 1,1
1 DIM R(250):FOR I=0 TO CX:R(I)=CY:NEXT I:GOTO 10
2 'R=SQR(X*X+Y*Y)*1.5: IF R=0 THEN F=90:GOTO 4

FP_Temp1=FLOATMUL(FP_X,FP_X)
FP_Temp2=FLOATMUL(FP_Y,FP_Y)
FP_Temp1=FLOATADD(FP_Temp1,FP_Temp2)
FP_R=FLOATSQR(FP_Temp1)
FP_R=FLOATMUL(FP_R,1.5)
IF CMPEQ(FP_R,0) THEN FP_F=90:GOTO 4

3 'F=90*SIN(R)/R

FP_Temp1=FLOATSIN(FP_R)
FP_Temp1=FLOATMUL(90,FP_Temp1)

```

```

FP_F=FLOATDIV(FP_Temp1,FP_R)
F=FP_F

4 'A=10*X+125-5*Y:B=5*Y+2.5*X+93:RETURN

FP_Temp1=FLOATMUL(10,FP_X)
FP_Temp2=FLOATMUL(5,FP_Y)
FP_A=FLOATADD(FP_Temp1,125)
FP_A=FLOATSUB(FP_A,FP_Temp2)
A=FP_A
FP_Temp1=FLOATMUL(5,FP_Y)
FP_Temp2=FLOATMUL(2.5,FP_X)
FP_B=FLOATADD(FP_Temp1,FP_Temp2)
FP_B=FLOATADD(FP_B,93)

B=FP_B

RETURN
10 FOR Y=100 TO -100 STEP -1
70 FOR X=100 TO -100 STEP -1
FP_Y=FLOATDIV(INT(Y),10)
FP_X=FLOATDIV(INT(X),10)
80 GOSUB 2
82 IF A<0 THEN A=0
83 IF A>255 then A=255
84 IF R(A)>B-F THEN R(A)=B-F:*PSET*(A,B-F)
90 NEXT X,Y
101 GOTO 101

```

Get Command

- Dimension Size Calculation

To calculate the size of the array space for your GET/PUT buffer use the following formula:

First dimension in the array is calculated with this formula:

```
(INT(Width in pixels/8)+3) * 8
```

Second dimension in the array is simply the number of rows in your sprite

For example, if you have a sprite that is 15 pixels wide and 9 rows high such as:

```
GET(0,0)-(14,8),Sprite1,G
```

The calculation for the needed space is:

```
(INT(15/8)+3)*8 = 32
```

The DIM command for this array would be:

```
DIM Sprite1(32,9)
```

If the calculated value for the first dimension of your GET buffer array is larger than 254 you will need to use these values for your array ``(INT(Width in pixels/8)+3) * 4 , Height in Pixels * 2``

```
GET(0,0)-(255,3),Sprite1,G
```

The calculation for the needed space is: ``(INT(256/8)+3)*4 = 140 , 4 * 2 = 8``

The DIM command for this array would be:

```
DIM Sprite1(140,8)
```

The reason so much space is needed for the GET buffer is because the GET command preprocesses the sprite data and saves bit shifted versions in the array space that are ready to be PUT on the screen as fast as possible. This means sprites will be just as fast on a byte boundary as it is on any other pixel.

New Graphics commands:

GMODE ModeNumber,GraphicsPage

Selects the graphics screen and the graphics page.

ModeNumber is the graphics mode you want to use

GraphicsPage is the Page you want to show/use for your graphics commands

To see a list of ModeNumbers and the resolutions go here [Special](#) note the ModeNumber must be an actual number and cannot be a variable as the compiler needs to know exactly which graphic mode commands to be included at compile time. GraphicsPage can be a variable. If you are going to use Graphic pages, the compiler needs to know how many pages to reserve in RAM (for CoCo 1 & 2 graphics). So you must have a GMODE #,MaxPages entry at the beginning of your BASIC program. Where the value of MaxPages will be an actual number and not a variable.

GCLS #

Colour the graphics screen

is the colour value you want the screen to be coloured

GCOPY SourcePage,DestinationPage

Makes a copy the Source graphics page to the Destination graphics page.

SourcePage - Source graphics page

DestinationPage - Destination graphics page

SET(x,y,Colour)

Sets a pixel on the screen

x,y - Screen location of the pixel to be drawn

Colour - Colour Number of the pixel to be drawn

POINT(x,y)

Returns the colour value of the pixel selected

x,y - Screen location of the pixel value requested

LINE(x0,y0)-(x1,y1),Colour[,B][F]

Draw a line

x0,y0 - Starting location

x1,y1 - Ending location

Colour -Colour of the Line or Box to draw

B - Draw a Box
F - Fill the Box

PAINT(x,y,OldColour,FillColour

Fills the old colour value with the fill colour value which must also be the border colour of the section you are painting

x,y - Starting location
OldColour - Colour Number
FillColour - Colour Number

CIRCLE(x,y),Radius,Colour

Draws a circle on the screen x,y

x,y - Origin of the circle
Radius - Size of the circle, to keep the aspect ratio close to round Some of the graphics modes use scaling so the Radius isn't always a count of actual pixel values.
Colour - Colour Number of the circle to draw

PALETTE v,Colour

Sets the CoCo 3 Palette value

v - palette slot of 0 to 15
Colour - Colour value of 0 to 63

DRAW, GET & PUT commands are not yet available

CoCo 1 & 2 Graphic Modes

GMODE #	Resolution	Colours	Bytes/Screen	Mode Name
0	32 x 16	9	512	internal alphanumeric

158	640 x 200	4	32000
159	640 x 225	4	36000

Limitations of the Compiler

- Other than support for **LOADM** it can't handle Disk access, but you can access the **CoCoSDC** for many disk type functions.
- **CIRCLE** command can only draw complete circles, you can't squeeze them or draw an arc

Error Handling

If your program isn't compiling, a lot of the times it's because the compiler is having a hard time parsing the program. Usually, making sure you have spaces between commands and variables and operators and variables.

You can often identify the source of an issue by examining the error message and the line number provided, which indicate where the compiler encountered a problem. If your program does not include line numbers, the error message will not be able to specify the exact line where the error occurred.

Also looking at the end of the actual `.asm` file it created might help to see what the compiler is trying to parse and failed.

Thanks

- I'd like to thank Scott Cooper (Tazman) for initial testing of the compiler.
- I'd also like to thank others on Discord who inspired me to keep adding new features, including Bruce D. Moore, Erico Monteiro.
- Typesetting of PDF documentation, Pete Willard

Change Log

For more info check out the blog post here: <https://wordpress.com/post/nowhereman999.wordpress.com/5054>

V 4.10

- Added text fonts that can be used directly in any graphics mode including CoCo 3 modes but not the semi graphic modes Use **LOCATE x,y** and **PRINT #-3,"Hello World"** to print to the graphics screen. You must select the font using the **-f** option. The font names end with **_Bx_Fx** where Bx is the Background colour and Fx is the Foreground colour. **Example: -fCoCoT1_B0_F2**
- Can now put compiler options on the first line of the program using **' CompilerOptions: -**
Example: 'CompileOptions: -fArcade_B0_F1 -o -s32

V 4.03

- Fixed a bug in the **GCOPY** command
- Tweaked the code for the **GMODE** command

V 4.02

- Numeric array sizes can now be larger than 255, it will now accept **DIM A(1000)** or **DIM MyArray(300,2,2)**
- String array sizes can now be larger than 255, it will now accept **DIM A\$(1000)** or **DIM MyArray\$(300,2,2)**, the default size for strings (which includes array elements) is 255 therefore you must use the compiler option **-sxxx** where xxx is the size of the string and make it a smaller string size if you are going to use many string arrays

V 4.01

- With the **GMODE ModeNumber,GraphicsPage** the compiler can now handle variables for the *GraphicsPage*value. The *ModeNumber*value will always need to be an actual number
- **PALETTE** command now will wait for a vsync to change the value (should make sure there's no sparkels)

V 4.00

- Added New command **GMODE** which allows you to easily select every graphic mode the CoCo 1,2 or 3 can produce
- Added New command **GCOPY** which allows you to copy graphic pages to other graphic pages
- Tweaked **LINE**, **CIRCLE** & **PAINT** commands to use all the available graphic modes and colours of the CoCo 1,2 or 3

V 3.03

- Tweaked the **AND**, **OR**, **XOR** commands as the optimizer was not handling them properly

V 3.02

- Fixed a bug with optimiing when it is doing exponents

V 3.01

- Fixed a small bug with Printing of double quotes ""

V 3.00

- Added SDC file support, you can now read and write files on the SDC filesystem directly
- If a 6309 is present it puts it in native mode (should speed up code about 15%)

- Added compiler option **-a** which makes your program autostart
- Fixed a bug where if a variable name had **AND,OR,MOD,XOR,NOT** or **DIVR** in the name it would create variable names and operators out of it
- Fixed a bug with IF command with multiple numeric commands that weren't evaluating properly

V 2.22

- Fixed a bug with a comment at the end of a **DATA** statement, it was sometimes not being ignored

V 2.21

- Fixed a bug handling close brackets

V 2.20

- Fixed handling of direct number conversion of a number that starts with a minus sign
- Fixed handling of **DATA** values that start with a minus sign
- Matched how BASIC converts a float to an INT (negative numbers always get the integer -1)
- Fixed a bug in multidimensional arrays

V 2.19

- Fixed **LINE-(x,y),PSET** command

V 2.18

- Fixed assigning a variable to numeric commands

V 2.17

- Added **CMPNE(FP_A,FP_B) * Floating Point Compare if Not Equal**

V 2.16

- Found a problem with comparing floating point numbers where the exponent was not being compared correctly
- Tweaked getting the 2nd value in a floating point number if it was a typed value
- Tweaked getting numeric value in as a floating point number can now handle the value if it starts with a decimal
- Tweaked the identification of a label and a variable

V 2.15

- Added limited Floating Point support by integrating the Floating point library * by Lennart Benschop
- Fixed a bug compiling single lines with **IF THEN ELSE**

V 2.14

- Added more commands for streaming audio directly off the CoCo SDC: SDCPLAYORCS, SDCPLAYORCL & SDCPLAYORCR These commands require either an Orchestra 90 or CocoFLASH (<https://www.go4retro.com/products/cocoflash/>) cartridge The **SDCPLAYORCS** command streams stereo 8 bit unsigned audio at 22,375hz to both the left and right channels The **SDCPLAYORCL** streams mono 8 bit unsigned audio at 44,750hz to the Left channel output The **SDCPLAYORCR** streams mono 8 bit unsigned audio at 44,750hz to the Right channel output
- Added version checking if the user is going to have SDC streaming commands like SDCPLAY as the SDC needs version 127 or higher
- Fixed handling of **REM's that were commenting out actual code, it now display better in the .asm file** It was also causing errors as some of the command values were printing as ASCII LF/BREAK/Carriage return symbols

V 2.13

- Added **SDCPLAY** command to let you play audio files directly off the CoCo SDC

V 2.12

- Added **GET** and **PUT** commands, added option for **PUT** command to use the usual **PSET** (default), **PRESET**, **AND**, **OR**, **NOT** but also added **XOR**

V 2.11

- Tweaked **PLAY** command, had problems with Quoted **PLAY** string

V 2.10

- Added **PLAY** command and tweaked **DRAW** command so it handles **;X** with a string if the **DRAW** command doesn't end with a semi colon
- Fixed a NASTY bug where certain bytes in **ADDASSEM/ENDASSEM** would write over actual program code

V 2.09

- Fixed a bug with **INKEY\$**

V 2.08

- Broke some regular printing with the printing to graphics screen, this is now been fixed
- Fixed a bug with getting the value of an expression before an open bracket if an array was before the open bracket

V 2.07

- Fixed a bug with **REM** or **'** at the end of a line that has variables in it, the line was past the variable name was being ignored by the parser

V 2.06

- Added feature to print to the PMODE 4 screen using **PRINT #-3,"Hello World"**, use **LOCATE x,y** to set the location on screen of the text
- Select which font from the commandline using option **-fxxxx** where xxxx is either **Arcade** or **CoCoT1**

V 2.05

- Added printing to the serial port with **PRINT #-2,**

V 2.04

- Added Disk I/O access commands in the file **Disk_Command.asm**
- The Compiler can now do a **LOADM** command

V 2.03

- Added **-v** (version) and **-h** (help) commandline options, now uses **-V** for verbose level

V 2.02

- Fixed issue with **INPUT** command with quotes and numeric commands being identified as numeric arrays

V 2.01

- Added option **-k** to allow the user to keep the temporary files that are generated when the compiler is processing the **.BAS** program. The default is to always delete these temp files.

V 2.00

- Can now handle many more variables
- Tokenizer can now parse code better, but still will require spaces in some cases in order to

distinguish between commands and variables

- Internally it's now a lot easier to add new BASIC commands.
- Drawing horizontal lines has been sped up a lot, this also speeds up drawing Boxes and Filling boxes with the ,B or ,BF options for the **LINE** command
- Handling of **DATA** commands is improved, it can handle multiple DATA : DATA commands on a single line and it can now handle string values without quotes, just as the CoCo will
- Compiler now has 3 programs to compile before you can use it. Load them into QB64 and compile them in the same folder as the other folders in the .zip file (Basic_Includes & Basic_Commands)
- The three programs are: **BasTo6809.bas**, **BasTo6809.1.Tokenizer.bas** & **BasTo6809.2.Compile.bas**
- Once all three are compiled start the compiler with the usual options as (or similar to):
./BasTo6809 -ascii -v0 -o2 -b0 YourProgram.bas

V 1.19

- The program now closes files #1 and #2 before killing the old one and renaming the Temp.txt to the correct .asm filename when removing unnecessary lines, this was causing file permission errors on Windows OS machines

V 1.18

- Fixed **ADDASSEM** and **ENDASSEM** which are now working correctly
- Added option and changed the code to allow the user to select the Max size of string arrays, max will be 255 but the user should be able to set it lower to save space

V 1.17

- Fixed numeric and String arrays with multi dimensions, wasn't storing the values properly
- Renamed include file **PRINT.ASM** to **Print.asm**
- Fixed VAL command, would return with zero if the string started with a space before the number
- Fixed the Print command, was ignoring , or ; after a string variable
